

## **Exercise: A remote Student list: Including broadcasts**

Modify the StudentList exercise (Server and Client) such that you also include broadcasts to Clients. Every time a student has been added to the Server model, all clients will be notified.

Note that you now

- Let the client handler (server-side) be a listener for the Server model in the Observer pattern
- Have two classes on the Client side, a client only sending and a Receiver (as a thread)
